## 8th grade

### Mental Math Solutions

<b>8th</b>	<b>Answer</b>	<b>Solution</b>
<b>1</b>	60 [%]	The probability of rain tomorrow is two fifths. As a percent, what is the probability that it will not rain tomorrow?  $1 - 2/5 = 3/5 = 60\%$
<b>2</b>	20 [minutes]	Jen rides her bike at an average rate of nine miles per hour. How many minutes does it take her to ride for three miles?  9 miles in 60 minutes = 3 miles in 20 minutes
<b>3</b>	12 [inches]	The perimeter of a regular octagon is ninety-six inches. In inches, what is the length of one of the sides of the octagon?  $96/8 = 12$
<b>4</b>	0 [prime numbers]	How many positive two-digit prime numbers have a five as their units digit?  Any number with 5 as the units digit is divisible by 5 and therefore, not a prime number.
<b>5</b>	4 [gum drops]	A jar has a mix of ten red gum drops, fifteen green gum drops, and twelve yellow gum drops. Except for their color, all of the gum drops are identical. How many gum drops must be pulled from the jar, without looking, to guarantee two gum drops of the same color?  On the first three draws it is possible to get one of each color. On the fourth draw there will have to be a matching pair.
<b>6</b>	10 [eggs]	A cake recipe calls for 3 cups of flour and 4 eggs. If the recipe is scaled up proportionately, how many eggs will be needed if seven and one-half cups of flour are used?  $(15/2)*4/3 = 10$
<b>7</b>	25	What is the mean of two to the first power, three to the second power, and four to the third power?  $2^1 + 3^2 + 4^3 = 2 + 9 + 64 = 75$ and the mean is $75/3 = 25$

**8**

$$[A + B =] 21$$

As a reduced common fraction, the ratio of positive three-digit multiples of twenty to positive three-digit integers is A over B. What is the value of A plus B?

100 to 980 = 20 \* 5 to 20 \* 49 makes 45 multiples of 20 and 100 to 999 is 900 three-digit multiples, so the ratio is  $45/900 = 1/20$  and  $1 + 20 = 21$

# “Math is Cool” Masters -- 2022-23

## 8th grade

### Individual Test Solutions

<b>8th</b>	<b>Answer</b>	<b>Solution</b>
<b>1</b>	60	Evaluate: $110 + 130 + 150 + 170 - 500$ $110 + 130 + 150 + 170 - 500 = 60$
<b>2</b>	348	What is the sum of the next three numbers in the following arithmetic sequence? $21, 40, 59, 78, \underline{\hspace{1cm}}, \underline{\hspace{1cm}}, \underline{\hspace{1cm}}$ $97 + 116 + 135 = 348$
<b>3</b>	12 [ways]	A room has exactly four doors. In how many ways can a person enter the room by one door and leave the room by a different door? $4 * 3 = 12$
<b>4</b>	40 [%]	What percent of 175 is 70? $70/175 = p/100, p = 40$
<b>5</b>	[x =] 17	Solve for x: $9x + 105 = 258$ $9x + 105 = 258 \rightarrow 9x = 153 \rightarrow x = 17$
<b>6</b>	287	What is the largest positive integer factor of the number 861, other than 861? $861 = 3 * 287$
<b>7</b>	76	Mariah's scores in her last three rounds of golf were 81, 77, and 78. What score would she need on her next round to lower the mean score for these four rounds to 78? $78 * 4 = 312$ , and $312 - (81 + 77 + 78) = 76$
<b>8</b>	8 [minutes]	A racecar drives at an average speed of 150 miles per hour. With this average speed, how long, in minutes, would it take the car to complete ten laps on a 2-mile track? 10 laps on a 2-mile track makes a total of 20 miles and 20 is $2/15$ of 150, and $2/15$ of an hour is 8 minutes.
<b>9</b>	450 [seconds]	How many seconds are in 7 and a half minutes? $7 * 60 + 30 = 450$
<b>10</b>	[A/B =] 25 [%]	A 3-inch by 3-inch square has area A and a 6-inch by 6-inch square has area B. What is the value of A/B as a percent? $A = 3 * 3 = 9$ and $B = 6 * 6 = 36$ and $9/36 = 25\%$

<b>11</b>	1599	What is the product of 41 and 39? $(40 + 1)(40 - 1) = 1600 - 1 = 1599$
<b>12</b>	32	My number is doubled. The result is then divided by 4 and then 20 is added. If the resulting number is 36, what is my number? $2x/4 + 20 = 36 \rightarrow 2x/4 = 16 \rightarrow 2x = 64 \rightarrow x = 32$
<b>13</b>	[A + B =] 11	A jar has 12 blue marbles and 16 green marbles. As a reduced common fraction, the probability that a randomly selected marble is not blue is A/B. What is the value of A + B? $P(\text{not blue}) = 16/28 = 4/7$ and $4 + 7 = 11$
<b>14</b>	[Q =] 9	Let P represent a prime number. Let Q represent a positive odd integer. What is the largest possible value of Q, such that P + Q = 11? $2 + 9 = 11$ , so the largest possible value of Q is 9.
<b>15</b>	24 [inches]	An equilateral triangle has sides of length 4 inches. The length of one side is multiplied by 1.5, the length of another side is multiplied by 2 and the length of the third side is multiplied by 2.5 to make a new triangle. What is the number of inches in the perimeter of the new triangle? $4(1.5) = 6$ , $4(2) = 8$ , $4(2.5) = 10$ , and $6 + 8 + 10 = 24$
<b>16</b>	16	What is the largest possible median in a set of nine distinct positive integers all less than 21? The set with the largest median is the set 12, 13, 14, 15, 16, 17, 18, 19, 20, and the median is 16.
<b>17</b>	288	What is the greatest product of any two distinct integer factors of 24? The two largest factors of 24 are 24 and 12 and $24 * 12 = 288$
<b>18</b>	[D =] [\$] 104 [dollars] or [\$] 104.00 [dollars]	Jen has D dollars that she wants to use to purchase concert tickets. If she tries to purchase two tickets, she will be short by 35% of the total cost. If she purchases one ticket, she will have \$24 left over. What is the value of D? $2C(.65) = D$ $D = C + 24$ $1.3C = C + 24$ $0.3C = 24$ $C = 80$ and $D = 80 + 24 = 104$

<b>19</b>	4 [sheets]	<p>The cost for a first-class letter (envelope and contents) sent through the USPS is 63 cents for up to 1 ounce. On average a standard business envelope weighs 0.238 ounces and a piece of 8.5" x 11" paper weighs 0.1696 ounces. How many full sheets of paper can go in a standard business envelope before the letter exceeds 1 ounce?</p> <p>Round 0.1696 to 0.17 and 0.238 to 0.24. <math>1 - 0.24 = 0.76</math>, so the number of sheets inside the envelope needs to be less than 0.76. <math>0.17 \times 4 = 0.68</math> and <math>0.17 \times 5 = 0.85</math>, so four sheets can go in the envelope without it exceeding 1 oz.</p>
<b>20</b>	13 [ways]	<p>How many ways are there to make 3 dollars with nickels and/or quarters?</p> <p>60N &amp; 0Q, 55N &amp; 1Q, 50N &amp; 2Q, ..., 10N &amp; 10Q, 5N &amp; 11Q, 0N &amp; 12Q, makes a total of 13 ways</p>
<b>21</b>	[P + Q =] 15	<p>On a coordinate plane, the coordinates of the vertices of <math>\Delta ABC</math> are labeled as shown. The coordinates of A are each multiplied by three resulting in <math>A'</math>, the coordinates of B are each multiplied by two-thirds resulting in <math>B'</math> and only the x-coordinate of C is divided by two resulting in <math>C'</math>. The area of <math>\Delta A'B'C'</math> is P.Q square units, where P is a two-digit integer and Q is a one-digit integer. What is the value of <math>P + Q</math>?</p> <p>The resulting triangle is shown above and has a base of 7 and a height of 3, so the area is <math>7 \times 3 / 2 = 10.5</math>, and <math>10 + 5 = 15</math>.</p>
<b>22</b>	[C + D =] 26	<p>A donkey takes 36 minutes to walk from point A to point B and the distance from point A to point B is <math>3/4</math> of a mile. The donkey's average speed in miles per hour is C.D, where C is a single-digit integer and D is a two-digit integer. What is the value of <math>C + D</math>?</p> <p><math>0.75 \text{ mi} = 36 \text{ min} \rightarrow 0.25 \text{ mi} = 12 \text{ min} \rightarrow 1.25 \text{ mi} = 60 \text{ min}</math>, which is 1.25 miles/hour, and <math>1 + 25 = 26</math>.</p>
<b>23</b>	80 [%]	<p>Each letter in the expression <math>\frac{A}{B} + \frac{C}{D}</math>, is replaced with one of the four digits 4, 5, 6, and 7, to make the largest possible sum and such that <math>A &gt; C</math>. As a percent, what is <math>B/D</math>?</p> <p><math>7/4 + 6/5 = 2.95</math>, and <math>7/5 + 6/4 = 2.9</math>, so the first one is the largest and <math>B/D = 4/5 = 80\%</math>.</p>

<b>24</b>	7 [ways]	Fern wants to make a sum greater than 40 by adding together some or all of the numbers in the following set: {1, 2, 3, 4, 5, 6, 7, 8, 9}. She can't use the same number more than once, and the order she adds the numbers in doesn't matter. How many different ways can she do this?  $1 + 2 + 3 + \dots + 7 + 8 + 9 = 45$ is one way Leave out the 1, the 2, the 3, or the 4, makes four more ways Leave out the 1 and 2, or the 1 and 3, makes two more ways $1 + 4 + 2 = 7$
<b>25</b>	112	For the function, $f(n) = \frac{n(n-3)}{2}$ , what is the sum of the eight function values resulting from integer inputs $n = 3$ through $n = 10$ ?  $0 + 2 + 5 + 9 + 14 + 20 + 27 + 35 = 112$
<b>26</b>	3456 [ $\text{in}^3$ ]	How many cubic inches are in two cubic feet?  $2 * 12 * 12 * 12 = 3456$
<b>27</b>	79	What is the largest two-digit integer that has a remainder of 1 when divided by 3, a remainder of 3 when divided by 4, and a remainder of 4 when divided by 5?  The smallest positive number that matches the description is 19, because it's in the following three lists: One more than multiples of 3: 1, 4, 7, 10, 13, 16, 19 Three more than multiples of 4: 3, 7, 11, 15, 19 Four more than multiples of 5: 4, 9, 14, 19 Then numbers that have this quality will repeat every 60, since 60 is the LCM of 3, 4, and 5, so $60 + 19 = 79$ .
<b>28</b>	[ $A + B =$ ] 710	Two cards are drawn from a standard deck without replacement. The probability as a reduced common fraction that the first card is a 10 and the second card is not a Jack is $A/B$ . What is the value of $A + B$ ?  $4/52 * 47/51 = 1/13 * 47/51 = 47/663$ , and $47 + 663 = 710$
<b>29</b>	24 [minutes]	It takes Biff 60 seconds to paint one board and it takes Eho 72 seconds to paint the same board. If Biff and Eho work together, how many minutes will it take them to paint forty-four such boards?  $1/60 + 1/72 = 1/x \rightarrow 6x + 5x = 360 \rightarrow x = 360/11$ seconds per board, so 33 boards would be $360/11 * 44 = 1440$ seconds or 24 minutes.

30	[A =] 54	<p>In the figure shown here, the diameter of the large circle is 18 centimeters. The three smaller circles are congruent, with their diameters coinciding with the diameter of the large circle. They are tangent to the large circle and each other as shown. The area of the shaded region is <math>A\pi \text{ cm}^2</math>. What is the value of A?</p> <p>The shaded area is <math>9^2\pi - 3 * 3^2\pi = 81\pi - 27\pi = 54\pi</math>, so <math>A = 54</math>.</p> 
31	[A + B =] 46	<p>A palindrome is an integer that reads the same forwards and backwards, such as 121. A 5-digit positive palindrome integer is divided by 111. As a reduced common fraction, the probability that the quotient is an integer and also a palindrome is <math>A/B</math>. What is the value of <math>A + B</math>?</p> <p>A five-digit number, when divided by 11111, will have either two or three number of digits.</p> <p>The only two-digit palindrome that gives five digits when multiplied by 11111 is 9999. However, <math>99 \cdot 111 = 1098999 \cdot 111 = 10989</math>, which is not a palindrome.</p> <p>Therefore, the result must have three digits and thus is of the form <math>100a+10b+a=101a+10b</math>, where <math>0 &lt; a &lt; 10</math> and <math>0 \leq b &lt; 10</math>.</p> <p>Multiplying this by 111 gives <math>11211a+1110b</math>. This can be arranged as <math>10000a+1000(a+b)+100(2a+b)+10(a+b)+a</math>.</p> <p>Then, <math>2a+b &lt; 10</math> (and <math>a+b &lt; 10</math>) must be true so that the symmetry will not be broken by the addition from carrying over to the next digit.</p> <p>For <math>a=1</math>, there are eight possible values for <math>b</math> that satisfy the inequality: all integers between 0 and 7. For <math>a=2</math>, there are six possible values for <math>b</math>. For <math>a=3</math>, there are four possible values for <math>b</math>. For <math>a=4</math>, there are two possible values for <math>b</math>. For <math>a&gt;4</math>, there is no integer solution for <math>b</math>. Thus, there are in total 20 possibilities.</p> <p>There are 900 five-digit palindromes (one for each integer between 100 and 999). Thus, the probability that a five-digit palindrome is both divisible by 111 and still produces a palindrome when divided by 111 is <math>20/900 = 1/45</math>. The final answer is <math>1+45=46</math>.</p>
32	3	<p>What is the sum of the integer solutions of <math>x</math> in the following inequality?</p> $\frac{1}{30} < \frac{2x}{5} - \frac{1}{6} < \frac{9}{10}$ $\frac{1}{30} < \frac{2x}{5} - \frac{1}{6} < \frac{9}{10} \rightarrow 1 < 12x - 5 < 27 \rightarrow 6 < 12x < 32 \rightarrow 6/12 < x < 32/12 \rightarrow 0.5 < x < 2.6666\dots, \text{ so the integer solutions are } 1 \text{ and } 2 \text{ and } 1 + 2 = 3.$
33	648 [numbers]	<p>How many positive three-digit base-9 numbers are there?</p> <p>Three-digit base-9 numbers range from <math>100_9</math> to <math>888_9</math>, so there can be 9 units digits, 9 9s digits and 8 81s digits, and <math>9 * 9 * 8 = 648</math>.</p>

<b>34</b>	[A + B =] 189	<p>The given expression simplifies to a reduced common fraction in the form A/B. What is the value of A + B?</p> $2 + \frac{3}{4 + \frac{5}{6 + \frac{7}{8}}}$ $2 + \frac{3}{4 + \frac{5}{6 + \frac{7}{8}}} = 2 + \frac{3}{4 + \frac{5}{11}} = 2 + \frac{33}{52} = 137/52 \text{ and } 137 + 52 = 189$
<b>35</b>	[P + Q =] 36	<p>In the figure shown here, <math>\Delta ABC</math> and <math>\Delta EDC</math> are right triangles, <math>\Delta ABC \sim \Delta EDC</math>, and the ratio of <math>DE/BA = 0.75</math>. If <math>CD = 6</math> cm and <math>DE = 15</math> cm, then <math>AE = P\sqrt{Q}</math> cm, where P is a single-digit prime number and Q is a two-digit prime number. What is the value of <math>P + Q</math>?</p> <p>Since the ratio is 3:4 and <math>CD = 6</math>, that means <math>BC = 8</math>, so <math>BD = 14</math>. Also, if <math>DE = 15</math>, then <math>AB = 20</math>, so to calculate <math>AE</math> use the Pythagorean Theorem, <math>(15 + 20)^2 + 14^2 = AE^2 \rightarrow 35^2 + 14^2 = AE^2 \rightarrow 1225 + 196 = AE^2 \rightarrow 1421 = AE^2 \rightarrow AE = \sqrt{1421} = 7\sqrt{29}</math>, and <math>7 + 29 = 36</math>.</p>
<b>36</b>	2 [n = ]	<p>Given that: <math>x + \frac{1}{x} = n</math>, and <math>x^2 + \frac{1}{x^2} = n</math>, where x and n are real numbers, find the sum of all possible values of n.</p> <p>Square the first equation:</p> $x^2 + \frac{1}{x^2} + 2 = n^2$ $x^2 + \frac{1}{x^2} = n^2 - 2$ <p>Equate the two expressions:</p> $n^2 - 2 = n$ $n^2 - n - 2 = 0$ $(n - 2)(n + 1) = 0$ $n = 2 \text{ or } -1$ <p>However, <math>n = -1</math> is not a possible solution to the second given equation, since both <math>x^2</math> and <math>1/x^2</math> are positive and 'n' is a real number. Therefore the only solution is <math>n = 2</math>.</p>
<b>37</b>	[P + Q =] 162	<p>A water tank can be filled by pipe A in 3 hours and by pipe B in 5 hours. Pump A is turned on and then after two hours pump B is also turned on. The number of minutes until the tank will be full after pump A was turned on is <math>P.Q</math>, where P is a three-digit integer and A is a single digit. What is the value of <math>P + Q</math>?</p> $(1/3)h + (1/5)(h - 2) = 1$ $5h + 3(h - 2) = 15$ $5h + 3h - 6 = 15$ $8h = 21$ $h = 2.625 \text{ hours} = 157.5 \text{ minutes}$ $\text{and } 157 + 5 = 162$

**38**

$$[A + B + C] = 18$$

A, B, and C represent single digits in the following addition problem.

$$\begin{array}{r} A & A & A \\ B & B & B \\ + C & C & C \\ \hline B & A & A & C \end{array}$$

If A, B, and C, are distinct positive integers, what is the value of A + B + C?

The units column must add up to  $10 + C$ . It cannot add up to C, unless A and B are both 0, which is not allowed. This means that  $A + B = 10$ .

The tens and hundreds columns must each add up to one more than the right-hand column, because a 1 got carried from the units column to the tens column, and from the tens column to the hundreds column. This means  $A = C + 1$ .

B must equal 1, since a 1 also gets carried from the hundreds column to the thousands column. If  $B = 1$ , then A must equal 9, since  $A + B = 10$ , and  $C = 8$ , since  $A = C + 1$ .

So, we have

$$\begin{array}{r} 9 & 9 & 9 \\ 1 & 1 & 1 \\ + 8 & 8 & 8 \\ \hline 1 & 9 & 9 & 8 \end{array}$$

and  $A + B + C = 18$ .

**39**

$$[A + B =] 1234$$

Whenever Tiger puts, he has a 60% chance of making the putt, independent of his previous putts. As a reduced common fraction, the probability of him making at least 1 of his next 4 putts is  $A/B$ . What is the value of A + B?

$$P(0 \text{ made putts}) = 1 * (2/5)^4$$

$$P(\text{at least 1 made putt}) = 1 - (1 * (2/5)^4) = 1 - 16/625 = 609/625, \text{ and } 609 + 625 + 1234$$

<b>40</b>	<p>53</p> <p>A 10<sup>th</sup> integer, A, when added to the following set, results in the median of the set equaling the mean of the set. What is the sum of all possible values of A?</p> <p>{10, 14, 15, 19, 22, 28, 31, 36, 39}</p> <p>The only number from 28 to 38, when inserted into the set, that makes the mean equal the median is 26.</p> <p>10,14,15,19,19,22,28,31,36,39, mean = 23.3 &amp; median = 20.5      10,14,15,19,20,22,28,31,36,39, mean = 23.4 &amp; median = 21      10,14,15,19,21,22,28,31,36,39, mean = 23.5 &amp; median = 21.5      10,14,15,19,22,22,28,31,36,39, mean = 23.6 &amp; median = 22      10,14,15,19,22,23,28,31,36,39, mean = 23.7 &amp; median = 22.5      10,14,15,19,22,24,28,31,36,39, mean = 23.8 &amp; median = 23      10,14,15,19,22,25,28,31,36,39, mean = 23.9 &amp; median = 23.5      10,14,15,19,22,26,28,31,36,39, mean = 24 &amp; median = 24      10,14,15,19,22,27,28,31,36,39, mean = 24.1 &amp; median = 24.5      10,14,15,19,22,28,28,31,36,39, mean = 24.2 &amp; median = 25</p> <p>There is one integer less than 19 and one integer greater than 28 that will cause the median and the mean to be equal. When the 10<sup>th</sup> number is less than 19, the median would be 20.5, which requires the sum of the 10 numbers to be 205. The tenth number would be 205 - (sum of original 9 numbers) = 205 - 214 = -9</p> <p>When the 10<sup>th</sup> number is greater than 28, then median would be 25, which requires the sum of the 10 numbers to be 250. The tenth number in this case is 250 - 214 = 36.</p> <p><math>A = 36 + 26 + -9 = 53</math></p>
-----------	--

**IF taking Algebra or Geometry, continue to questions 41 – 42.**

<b>41</b>	<p>[<math>a + b + c + d =</math>] 90</p> <p>The simplified polynomial expression which results from multiplying <math>(2x - 7)(x + 2)(5x - 11)</math> together is in the form <math>ax^3 + bx^2 + cx + d</math>. What is the value of <math>a + b + c + d</math>?</p> <p><math>(2x - 7)(x + 2)(5x - 11) = (2x^2 - 3x - 14)(5x - 11) = 10x^3 - 15x^2 - 70x - 22x^2 + 33x + 154 = 10x^3 - 37x^2 - 37x + 154</math>, and <math>10 + -37 + -37 + 154 = 90</math></p>
<b>42</b>	<p>[<math>a + b =</math>] -1</p> <p>A line perpendicular to the line with equation <math>2x - 5y = 12</math> passes through the point (-1, 3). The point of intersection of the two lines is (a, b). What is the value of <math>a + b</math>?</p> <p>The slope of the line with equation <math>2x - 5y = 12</math> is <math>2/5</math>, so the slope of the perpendicular line is <math>-5/2</math>. Calculate the y-intercept of the perpendicular line: <math>3 = (-5/2)(-1) + b \rightarrow b = 1/2</math>. Solve the system of equations:</p> $\begin{cases} 2x - 5y = 12 \\ y = -\frac{5x}{2} + \frac{1}{2} \end{cases} \rightarrow \begin{cases} 2x - 5y = 12 \\ 5x + 2y = 1 \end{cases} \rightarrow \begin{cases} 10x - 25y = 60 \\ 5x + 2y = 1 \end{cases} \rightarrow \begin{cases} 10x + 4y = 2 \\ 29y = 58 \end{cases} \rightarrow y = -2 \text{ and } x = 1, \text{ and } 1 + -2 = -1$

**IF taking Geometry, continue to questions 43 – 45.**

<b>43</b>	<p>15</p> <p>What integer, when added to ten times its reciprocal, equals <math>47/3</math>?</p> <p>Let <math>x</math> = the integer, then <math>x + 10/x = 47/3 \rightarrow 3x^2 + 30 = 47x \rightarrow 3x^2 - 47x + 30 = 0 \rightarrow (3x - 2)(x - 15) = 0 \rightarrow x = 2/3 \text{ or } 15</math>, and 15 is the integer.</p>
-----------	---

**44**

13 [cm]

The oblique cylinder shown below has a volume of  $637\pi \text{ cm}^3$  and a diameter of 14 cm. In centimeters, what is the height of the cylinder?

$$V = \pi r^2 h, \text{ so } 637\pi = \pi 7^2 h \rightarrow 637\pi = 49\pi h \rightarrow 637/49 = h = 13$$

**45**

176 [inches]

In the figure below, the triangle is equilateral and has an area of  $64\sqrt{3}$  square inches. The pentagon and

the heptagon are both also equilateral and the length of their sides is equal to the length of the sides of the triangle. In inches, what is the perimeter of the figure?

If the area of the triangle is  $49\sqrt{3}$  square inches, then the side length can be solved for with the equation  $s^2\sqrt{3}/4 = 64\sqrt{3} \rightarrow s^2 = 256 \rightarrow s = 16$ , so the perimeter is  $16 + 4 * 16 + 6 * 16 = 11 * 16 = 176$ .

**REFER TO THE FOLLOWING INFORMATION FOR PROBLEMS #4 THROUGH #6.**

Figure A below is a  $12 \times 16 \times 20$ -centimeter rectangular prism with a hole passing horizontally through its center that is also in the shape of a rectangular prism. The bases of the rectangular-prism-shaped hole are  $8 \times 9$  centimeters and are in the same plane as the right and left faces of the large prism.

**Figure A**

<b>4</b>	<b>C</b>	<p>What is the volume of the rectangular-prism-shaped hole in Figure A?</p> <p>A) <math>688 \text{ cm}^3</math>   B) <math>864 \text{ cm}^3</math>   C) <math>1152 \text{ cm}^3</math>   D) <math>1440 \text{ cm}^3</math>   E) <math>3840 \text{ cm}^3</math></p> <p><math>8 * 9 * 16 = 1152</math></p>
<b>5</b>	<b>B</b>	<p>Let P be the volume of Figure A. A solid rectangular prism with the same dimensions as Figure A, but with no holes, has volume Q cubic centimeters. As a percentage, what is <math>P/Q</math>?</p> <p>A) 72%   B) 70%   C) 68%   D) 64%   E) 60%</p> <p><math>P = \text{Volume of Figure A} = 3840 - 1152 = 2688</math>  <math>Q = \text{Volume of the solid prism} = 12 * 16 * 20 = 3840</math>  <math>P/Q = 2688/3840 = 672/960 = 168/240 = 42/60 = 7/10 = 70\%</math></p>
<b>6</b>	<b>C</b>	<p>Assume the interior faces of the rectangular-prism-shaped hole are part of the surface area of Figure A. What is the surface area of Figure A?</p> <p>A) <math>1152 \text{ cm}^2</math>   B) <math>1760 \text{ cm}^2</math>   C) <math>1904 \text{ cm}^2</math>   D) <math>2048 \text{ cm}^2</math>   E) <math>2120 \text{ cm}^2</math></p> <p><math>16 * 12 * 2 + 16 * 20 * 2 + (12 * 20 - 9 * 8) * 2 + 8 * 16 * 2 + 9 * 16 * 2 = 384 + 640 + 336 + 256 + 288 = 1904</math></p>

**USE THE FOLLOWING INFORMATION TO SOLVE PROBLEMS #7 THROUGH #10.**

In the three infinite sequences below, 9 is the first term in sequence A, and 1 is the first term in sequence B and in sequence C.

A: 9, 22, 35, 48, 61, 74, ...

B: 1, 3, 6, 10, 15, 21, ...

C: 1, 3, 9, 27, 81, 243, ...

<b>7</b>	<b>D</b>	What is the sum of the next number in each of the three series?  A) 874    B) 864    C) 854    D) 844    E) 834  $729 + 87 + 28 = 844$
<b>8</b>	<b>C</b>	What is the mean of the first 8 numbers in sequence C?  A) 406.375    B) 408    C) 410    D) 412.5    E) 412.625  $(1 + 3 + 9 + 27 + 81 + 243 + 729 + 2187)/8 = 3280/8 = 410$
<b>9</b>	<b>E</b>	Select the answer which gives the correct rule for each series, where n stands for the series of positive integers, 1, 2, 3, ...  A) A: $13n + 4$ , B: $n(n-1)/2$ , C: $3^{n-1}$ B) A: $9n + 13$ , B: $n(n-1)/2$ , C: $3^n$ C) A: $13n - 4$ , B: $n(n-1)/2$ , C: $3^n$ D) A: $13n$ , B: $n(n+1)/2$ , C: $3^n$ E) A: $13n - 4$ , B: $n(n+1)/2$ , C: $3^{n-1}$  $13(1) - 4 = 9, 13(2) - 4 = 22, 13(3) - 4 = 35$ , etc. $1(1+1)/2 = 1, 2(2+1)/2 = 3, 3(3+1)/3 = 6$ , etc. $3^{1-1} = 1, 3^{2-1} = 3, 3^{3-1} = 9$ , etc.

**10****B**

Let P represent the largest 3-digit integer in series A, let Q represent the largest 3-digit integer in series B, and let R represent the largest 3-digit integer in series C. Which of the following is the prime factorization of the least common multiple of P, Q, and R?

- A)  $2 * 3^4 * 5 * 11 * 499$
- B)  $2 * 3^6 * 5 * 11 * 997$
- C)  $2 * 3^6 * 5 * 11 * 199$
- D)  $2 * 3^4 * 5 * 11 * 997$
- E)  $2^2 * 3^6 * 5 * 11 * 83$

A:  $13n - 4 < 1000 \rightarrow 13n < 1004 \rightarrow n < 77\frac{3}{13}$ , and  $13(77) - 4 = 997 = P$  = prime factorization, since it is prime

B:  $n(n+1)/2 < 1000 \rightarrow n^2 + n - 2000 < 0$ , if  $n = 45$ , then  $n^2 + n - 2000 > 0$ , if  $n = 44$ , then  $n^2 + n - 2000 < 0$ , so the largest 3-digit integer will be when  $n = 44$ , which is  $990 = Q = 2 * 3^2 * 5 * 11$

C: 729 is the largest 3-digit integer in this series, so  $729 = R = 3^6$   
So, the LCM is  $2 * 3^6 * 5 * 11 * 997$

### Team Test Solutions

<b>8th</b>	<b>Answer</b>	<b>Solution</b>
<b>1</b>	<b>29</b>	Evaluate: $4(17 - 11) + 320/64$ $4(17 - 11) + 320/64 = 4(6) + 5 = 29$
<b>2</b>	<b>684</b> <b>[inches]</b>	How many inches are in 19 yards? $3 * 12 * 19 = 684$
<b>3</b>	<b>36</b>	Let $a \star b = ab + ba$ (a times b plus b times a). What is the value of $3 \star 6$ ? $3 \star 6 = 3(6) + 6(3) = 18 + 18 = 36$
<b>4</b>	<b>5 [apples]</b>	If 15 apples cost the same as 18 bananas and 4 bananas cost the same as 2 pears, how many apples cost the same as 3 pears? $15a = 18b$ and $4b = 2p$ , so $18b = 9p$ and $15a = 9p$ and $5a = 3p$ , so the answer is 5.
<b>5</b>	<b><math>[A + B =]</math> 400</b>	A track has two straight sections that are each 150 meters long and two semicircular ends, each with a diameter of 100 meters as shown below. In terms of $\pi$ , the perimeter of the track is $A\pi + B$ meters. What is the value of $A + B$ ? The length of the two semicircular ends is $100\pi$ and the length of the two straight sections combined is 300, so the length of the tract is $100\pi + 300$ , and $100 + 300 = 400$ .

6	70 [days]	<p>Buzz is traveling to the Planet Zog, which is twenty-eight light years away, and his spaceship travels fourteen light years every twenty-one days. A third of the way through the trip, he realizes he forgot his ray blaster at home and goes back for it. In days and from the moment he first leaves, how long does it take for Buzz to reach the Planet Zog?</p> <p><math>28/14 = 2</math>, so <math>2 * 21 = 42</math> is the number of days it would take without a delay. The delay is <math>(1/3)42 * 2 = 28</math>, so <math>42 + 28 = 70</math>.</p>
7	-9	<p>An arithmetic sequence can be described by the rule <math>2n + 1</math>, where <math>n</math> can be any integer. What is the sum of the three largest negative numbers in the sequence?</p> $-1 + -3 + -5 = -9$
8	$[A + B =]$ <b>248</b>	<p>As a reduced common fraction, the probability that the product of any three randomly selected and not necessarily distinct single-digit positive integers is 12 is <math>A/B</math>. What is the value of <math>A + B</math>?</p> <p>Total possible outcomes equals <math>9 * 9 * 9 = 729</math>  The 15 outcomes where the product is 12 include: (1,2,6), (1,6,2), (2,1,6), (2,6,1), (6,1,2), (6,2,1), (1,3,4), (1,4,3), (3,1,4), (3,4,1), (4,1,3), (4,3,1), (2,2,3), (2,3,2), (3,2,2)  So, <math>A/B = 15/729 = 5/243</math>, and <math>5 + 243 = 248</math></p>

**9**

**22**  
[rectangles]

How many rectangles of any size are in the figure below?

$$3 + 2 + 2 + 2 + 2 + 2 + 1 + 2 + 2 + 1 + 2 + 1 = 22$$

**10****384**

Enrique's locker combination is a positive three-digit integer, where each digit is a unique number from 1 to 9 inclusive. One morning while opening his locker, Enrique realized that if he multiplied the three digits of the number together, the product would be exactly one-fourth of the number that is his locker combination. What is Enrique's locker combination?

Let the locker combination be ABC, where A = hundreds digit, B = tens digit, C = units digit. Can write an equation:

$$A \times B \times C = (1/4)(100A + 10B + C)$$

In other words, the product of the three digits equals one-fourth of the number itself.

Therefore, the number itself must be divisible by 4, meaning that the last two digits BC must be divisible by 4. There are no 0s in the number, and B and C are different digits. This narrows down the list of BC to: 12, 16, 24, 28, 32, 36, 48, 52, 56, 64, 68, 72, 76, 84, 92, and 96. A little trial and error can be used to try and get the magnitude of the number about right, and discover that the only number that works is 384, since  $\frac{1}{4}(384) = 3 \times 8 \times 4 = 96$ .

1	429	<p>What is the next number in the following arithmetic sequence?</p> <p>513, 492, 471, 450, _____</p> <p>The numbers are getting smaller by 21, so <math>450 - 21 = 429</math>.</p>
2	104	<p>Let A be the median of data set #1, let B be the median of data set #2, and let C be the median of data set #3. What is the mean of A, B, and C?</p> <p>Data set #1 - {19, 23, 29, 31, 37, 41, 43}</p> <p>Data set #2 - {35, 70, 105, 120, 135, 150}</p> <p>Data set #3 - {1, 16, 81, 256, 625, 1296}</p> <p>A = 31, B = 112.5, and C = 168.5 and <math>(31 + 112.5 + 168.5)/3 = 312/3 = 104</math></p>
3	60 [%]	<p>Riley eats <math>1/3</math> of a cake and Beau eats <math>1/15</math> of the cake. After this, what percent of the cake has not been eaten?</p> <p><math>1 - 1/3 - 1/15 = 9/15 = 60\%</math></p>
4	8 [ways]	<p>How many ways can you make 75 cents with nickels and/or dimes?</p> <p>15N &amp; 0D, 13N &amp; 1D, 11N &amp; 2D, 9N &amp; 3D, 7N &amp; 4D, 5N &amp; 5D, 3N &amp; 6D, 1N &amp; 7D makes 8 ways</p>

5	1 [bowl A]	<p>Bowl A contains 14 green skittles, bowl B contains 15 red skittles, and bowl C contains 18 orange skittles. Six green skittles are moved to bowl B, five red skittles are moved to bowl C and seven orange skittles are moved to bowl A. Which bowl has the fewest skittles in it after these moves? Answer 1 for bowl A, 2 for bowl B, 3 for bowl C, or 4 if no one bowl has the fewest skittles.</p> <table border="1" data-bbox="698 460 1220 587"> <thead> <tr> <th></th><th>Start</th><th>Moves</th><th>End</th></tr> </thead> <tbody> <tr> <td>Bowl A</td><td>14</td><td><math>14 - 6 + 7</math></td><td>15</td></tr> <tr> <td>Bowl B</td><td>15</td><td><math>15 - 5 + 6</math></td><td>16</td></tr> <tr> <td>Bowl C</td><td>18</td><td><math>18 - 7 + 5</math></td><td>16</td></tr> </tbody> </table> <p>Bowl A has the fewest, so the answer is 1.</p>		Start	Moves	End	Bowl A	14	$14 - 6 + 7$	15	Bowl B	15	$15 - 5 + 6$	16	Bowl C	18	$18 - 7 + 5$	16
	Start	Moves	End															
Bowl A	14	$14 - 6 + 7$	15															
Bowl B	15	$15 - 5 + 6$	16															
Bowl C	18	$18 - 7 + 5$	16															
6	23 [respondents]	<p>A survey is given to 90 people, and everyone chooses one of four options: 1) plays golf, but not tennis, 2) plays golf, but not tennis, 3) plays both golf and tennis, 4) plays neither. Based on the results, the probability that someone chose option 1 is <math>5/18</math>, the probability that someone chose option 2 is <math>1/3</math>, and the probability that someone chose option 3 is <math>2/15</math>. How many respondents chose option 4?</p> <p><math>5/18(90) + 1/3(90) + 2/15(90) = 25 + 30 + 12 = 67</math> and the rest play neither, so <math>90 - 67 = 23</math>.</p>																
7	8 [even integers]	<p>Twin primes are pairs of prime numbers that differ by 2, such as 3 and 5. Consecutive pairs of twin primes are two pairs of twin primes with no other pair of twin primes between them, such as (17, 19) and (29, 31), and these two pairs of twin primes have the even integers 20, 22, 24, 26, and 28 between them. What is the greatest number of even integers between any two pairs of consecutive two-digit twin primes?</p> <p>The two-digit pairs of twin primes are (11, 13), (17, 19), (29, 31), (41, 43), (59, 61), and (71, 73), and between 43 and 59, there are 8 even integers, 44, 46, 48, 50, 52, 54, 56, and 58.</p>																

8	$[A =] 245$	<p>Let <math>A</math> be a positive three-digit integer in which all three digits are different. What is the largest value of <math>A</math>, such that four times <math>A</math>, or <math>4A</math>, is also a three-digit integer with three different digits and <math>A</math> and <math>4A</math> have no digits in common?</p> <p><math>250 \times 4 = 1000</math>, so start checking numbers that are less than 250</p> <p><math>249 \times 4 = 996</math>, <math>A</math> and <math>4A</math> have a 9 in common and <math>4A</math> has two 9s</p> <p><math>248 \times 4 = 992</math>, <math>A</math> and <math>4A</math> have a 2 in common and <math>4A</math> has two 9s</p> <p><math>247 \times 4 = 988</math>, <math>4A</math> has two 8s</p> <p><math>246 \times 4 = 984</math>, <math>A</math> and <math>4A</math> have a 4 in common</p> <p><math>245 \times 4 = 980</math>, this one works, so the answer is 245</p>
9	$[A + B =] 1711$	<p>The second term of a six-term geometric sequence is 7 and the fifth term is 189. As a reduced common fraction, the sum of the first and sixth terms of the sequence is <math>A/B</math>. What is the value of <math>A + B</math>?</p> <p><math>189/7 = 27</math> so the numbers in the series are multiplying by 3 each time. The series is then, <math>7/3</math>, 7, 21, 63, 189, and 567. The sum of the first and sixth terms is <math>7/3 + 1701/3 = 1708/3</math> and <math>1708 + 3 = 1711</math></p>
10	$[A + B + C =]$ <b>38</b>	<p>The area of the small square that is inscribed in the circle is <math>9 \text{ cm}^2</math>. The combined area in <math>\text{cm}^2</math> of all the shaded regions, including the small square is <math>A - \frac{B\pi}{C}</math>, where <math>\frac{B\pi}{C}</math> is in terms of <math>\pi</math> and in lowest terms, and <math>A</math>, <math>B</math>, and <math>C</math> are positive integers. What is the value of <math>A + B + C</math>?</p> <p>The side length of the small square is <math>\sqrt{9} = 3 \text{ cm}</math>, so the diagonal is <math>3\sqrt{2} \text{ cm}</math>, which is also the diameter of the circle and the side length of the large square. The area of the large square is <math>(3\sqrt{2})^2 = 18</math> and the area of the circle is <math>(3\sqrt{2}/2)^2\pi = 9\pi/2</math>, so the total combined shaded area is <math>18 - 9\pi/2 + 9 = 27 - 9\pi/2</math>, and the answer is <math>27 + 9 + 2 = 38</math>.</p>

## 8th grade

### College Bowl Round #1 Solutions

<b>8th</b>	<b>Answer</b>	<b>Solution</b>
<b>1</b>	8	What is forty percent of twenty percent of one hundred? 20% of 100 is 20, 40% of 20 is 8
<b>2</b>	$[A + B =] 58$	A jar contains eleven sugar cookies and seven oatmeal cookies. As a reduced common fraction, the probability that two randomly selected cookies from the jar are both oatmeal is A over B. What is the value of A plus B? $7/18 * 6/17 = 7/51$ and $7 + 51 = 58$
<b>3</b>	500,000 [square meters]	How many square meters are in one-half of a square kilometer? $1/2 * 1000 * 1000 = 500000$
<b>4</b>	312	Let WX and YZ each represent a two-digit integer. If the digits W, X, Y and Z are all different and none of them is zero, what is the smallest possible value of the product of WX and YZ? The smallest four digits are 1, 2, 3, and 4, so use combinations of these. To minimize the product, use 1 in the tens place for one and 2 in the tens place for the other. The product will be smaller the farther apart the numbers are, so $13 * 24$ will be smaller than $14 * 23$ , and $13 * 24 = 312$ .
<b>5</b>	6600 [hops]	Some kangaroos can travel thirty miles per hour and hop a horizontal distance of twenty-four feet. At these rates, how many hops would a kangaroo travel in one hour? The number of feet in a mile is 5280 ft, and $5280/24$ is 220 hops per mile. $220 \text{ hops/mile} * 30 \text{ miles/hour} = 6600 \text{ hops/hr.}$
<b>6</b>	$[k =] 2$	What is the value of K, such that the linear equation Y equals KX plus five has a solution point of two comma nine? The y-intercept of the equation $y = kx + 5$ is $(0, 5)$ , so to go through the point $(2, 9)$ means a rise of 4 and a run of 2 and $4/2 = 2$ , which is the value of k.
<b>7</b>	$[D =] 1$	If A plus three equals B and B minus four equals C, then A equals C plus D. What is the value of D? $A + 3 = B$ and $B - 4 = C$ , so $B = C + 4$ , and $A + 3 = C + 4$ , so $A = C + 1$ , and $D = 1$

<b>8</b>	63 [cats]	The ratio of dogs to cats in an animal shelter is thirty-two to twenty-one. If there are one hundred and fifty-nine total dogs and cats in the shelter combined, how many of the animals are cats? $32 + 21 = 53$ and $159/53 = 3$ , so there are $3 * 21 = 63$ cats
<b>9</b>	320 [minutes]	Let eighty divided by fifteen equal X. How many minutes are in X hours? $80/15*60 = 320$
<b>10</b>	26 [minutes]	The lengths of Fido's last three walks have been twenty-three, seventeen, and thirty-four minutes. How many minutes should the next walk be such that the average length of all four walks is twenty-five minutes? $23 + 17 + 34 + x = 25*4 \rightarrow 74 + x = 100 \rightarrow x = 26$ .

## 8th grade

### College Bowl Round #2 Solutions

<b>8th</b>	<b>Answer</b>	<b>Solution</b>
<b>1</b>	2401	What is seven to the fourth power? $7^4 = 2401$
<b>2</b>	75 [minutes]	Ishan is looking for a needle in a haystack. It takes him five minutes to sift through two cubic feet of hay. How long, in minutes, does it take Ishan to sift through thirty cubic feet of hay? $30/2 = 15$ and $15 \times 5 = 75$
<b>3</b>	7 [numbers]	How many composite numbers are there from forty to forty-nine, inclusive? 40, 42, 44, 45, 46, 48, 49, makes 7 composite numbers
<b>4</b>	6	What is the mean of the square root of one hundred, the cube root of one hundred twenty-five, and the fourth root of eighty-one? $\sqrt{100} + \sqrt[3]{125} + \sqrt[4]{81} = 10 + 5 + 3 = 18$ , and $18/3 = 6$
<b>5</b>	81 [days]	It takes nine workers nine days to build nine walls. Working at the same rate, how many days does it take two workers to build eighteen walls? 9 workers, 9 days, 9 walls is equivalent to 1 worker, 81 days, 9 walls, so 2 workers would take 81 days to build 18 walls
<b>6</b>	120 [degrees]	The ratio of the angles in a triangle is one to three to eight. What is the angle measure, in degrees, of the largest angle? $x + 3x + 8x = 180$ $12x = 180$ $x = 15$ $8x = 120$
<b>7</b>	174 [tolls]	Each hour of the day one through twelve, a bell tolls the same number of times as the time of day. It also tolls eight times each hour to make a melody prior to tolling the time of day. How many total tolls are there in one twelve-hour stretch? $8*12 + 1 + 2 + 3 + 4 + 5 + 6 + 7 + 8 + 9 + 10 + 11 + 12 = 96$ $+ 12(13)/2 = 96 + 78 = 174$

<b>8</b>	12	Twice my number minus half of my number equals eighteen. What is my number? $2x - 0.5x = 18$ $1.5x = 18$ $x=12$
<b>9</b>	53	Evaluate one thousand three hundred seventy-eight divided by twenty-six. $1378/26=53$
<b>10</b>	87	The first three terms of an arithmetic sequence are three, seventeen, and thirty-one. What is the seventh term in the sequence? 3, 17, 31, 45, 59, 73, 87 or $3 + 14 * 6 = 87$

# “Math is Cool” Masters -- 2022-23

## 8th grade

### College Bowl Round #3 Solutions

<b>8th</b>	<b>Answer</b>	<b>Solution</b>
<b>1</b>	$[A + B =] 59$	The median of all positive two-digit integers is A point B, where A is a two-digit integer and B is a single-digit integer. What is the value of A plus B? Since it's an arithmetic series, the average of the first and last numbers is the same as the median, so $10 + 99 = 109$ and $109/2 = 54.5$ and $54 + 5 = 59$
<b>2</b>	$[P - Q =] 1$	Alf is taller than Barb, Barb is taller than Cam, Doug, and Evy. As a common fraction, the ratio of persons who could be the shortest in the group to persons who could not be the shortest is P over Q. What is P minus Q? Cam, Doug, or Evy could be the shortest, Alf and Barb cannot be the shortest, so the ratio is $3/2$ and $3 - 2 = 1$
<b>3</b>	6	What is the remainder when three thousand twenty-one is divided by fifteen? $201*15 = 3015$ and $3021 - 3015 = 6$
<b>4</b>	28 [cm]	The height of a triangle is four times the base. The area of the triangle is ninety-eight square centimeters. In centimeters, what is the height of the triangle? Let $h = 4b$ , then $98 = 4b(b)/2 \rightarrow 2b^2 = 98 \rightarrow b^2 = 49 \rightarrow b = 7$ , so the height is $4*7 = 28$ . $2/11*9/10*8/9*3 = 48/110 = 24/55$ , so $24 + 55 = 79$ .
<b>5</b>	$[A + B =] 79$	In a group of eleven pickleballers, two are left-handed. As a reduced common fraction, the probability that exactly one of three randomly selected players is left-handed is A over B. What is the value of A + B? $2/11*9/10*8/9*3 = 48/110 = 24/55$ , so $24 + 55 = 79$ .
<b>6</b>	3 [values]	A Mersenne prime is a prime number that can be expressed as negative one plus two to the power of a positive integer N. How many values of N from one to six inclusive result in Mersenne primes? $2^1 - 1 = 1$ , $2^2 - 1 = 3$ , $2^3 - 1 = 7$ , $2^4 - 1 = 15$ , $2^5 - 1 = 31$ , $2^6 - 1 = 63$ , and 3, 7, and 31 are primes, so the answer is 3.

<b>7</b>	64 [feet]	On Jeb's first six shots on a hole in miniature golf the ball gets closer to the hole by exactly half its remaining distance to the hole. After six shots, the ball is one foot from the hole. How many feet from the hole was the ball originally? In the series, 1, 2, 4, 8, 16, 32, and 64, 64 would represent the distance to the hole before his first shot.
<b>8</b>	440 [yds]	How many yards are in one fourth of a mile? $5280/3 = 1760$ yards in a mile: $1760/4=440$
<b>9</b>	171 [elbow bumps]	How many elbow bumps occur in a room of nineteen people if each person bumps elbows with every other person once? $18 + 17 + \dots + 2 + 1 = 19(18)/2 = 171$
<b>10</b>	[x =] 4	If three-halves X plus fifteen-halves equals twenty-seven halves, what is the value of X? $3x/2 + 15/2 = 27/2 \rightarrow 3x + 15 = 27 \rightarrow 3x = 12 \rightarrow x = 4$

# “Math is Cool” Masters -- 2022-23

## 8th grade

### College Bowl Round #4 Solutions

<b>8th</b>	<b>Answer</b>	<b>Solution</b>
<b>1</b>	9 [factors]	<p>How many positive integer factors does the number one hundred have?</p> <p>The factors of 100 are, 1, 2, 4, 5, 10, 20, 25, 50, and 100, and there are 9 on them, or <math>100 = 2^2 * 5^2</math>, so the number of factors is <math>3*3 = 9</math>.</p>
<b>2</b>	133 [ $\text{ft}^2$ ]	<p>A certain wall has an area of one hundred and seventy-one square feet. Biff paints two-ninths of the wall and Echo paints the rest. How many square feet are in the section that Echo paints?</p> $7/9 * 171 = 7*19 = 133$
<b>3</b>	38	<p>What is the mean of the following five numbers: ninety, forty, thirty, twenty, and ten?</p> $90 + 40 + 30 + 20 + 10 = 190 \text{ and } 190/5 = 38$
<b>4</b>	96 [ $\text{in}^2$ ]	<p>A rectangle has dimensions twelve by thirty-two inches. Four triangles are created by drawing the diagonals. In square inches, what is the area of one of these triangles?</p> <p>All four triangles have the same area, so the area of any one of the triangles is <math>12(32)/4 = 96</math></p>
<b>5</b>	4 [years old]	<p>Anya is four years older than Ben. Two years ago, Anya was three times Ben's age. How old is Ben right now, in years?</p> $\begin{cases} A = B + 4 \\ A - 2 = 3(B - 2) \end{cases} \Rightarrow$ $\begin{cases} A = B + 4 \\ A = 3B - 4 \end{cases} \Rightarrow$ $B + 4 = 3B - 4 \Rightarrow$ $2B = 8 \Rightarrow B = 4$
<b>6</b>	27 [min]	<p>Varun averaged thirty miles per hour driving to work. On his drive back home, he averaged twenty-four miles per hour, and it took three minutes longer than the drive to work. What was the total number of minutes spent driving to and from work?</p> <p><math>D = rt</math>, <math>D = 30t</math> and <math>D = 24(t + 3)</math>, so <math>30t = 24(t + 3)</math>, <math>30t = 24t + 72</math>,</p> $6t = 72, t = 12 \text{ and } t + 3 = 15,$ $12 + 15 = 27$

<b>7</b>	[N =] 5	The first term of a decreasing geometric series is five hundred seventy-six, the second term is four hundred thirty-two, and the third term is three hundred twenty-four. The Nth term in the series is the first non-integer value. What is the value of N? 576, 432, 324, 243, $729/4$ , ... so the 5 <sup>th</sup> term is not an integer and N = 5
<b>8</b>	38 [cups]	Darli buys one cup of coffee every weekday, and two cups of coffee every Saturday and every Sunday. Assuming that June 1st is on a Monday, how many total cups of coffee will she buy during the month of June? $9 * 4 = 36$ $36 + 2 = 38$
<b>9</b>	180 [ways]	How many ways can you arrange the letters in the word "google", spelled G-O-O-G-L-E? $6!/(2!*2!) = 180$
<b>10</b>	349	Eighty-seven point two five is twenty-five percent of what number? $87.25 * 4 = 349$

# “Math is Cool” Masters -- 2022-23

## 8th grade

### College Bowl Round #5 Solutions

<b>8th</b>	<b>Answer</b>	<b>Solution</b>
<b>1</b>	[ $A + B =$ ] 29	As a reduced common fraction, the probability of randomly drawing a red face card from a standard deck is $A$ over $B$ . What is the value of $A$ plus $B$ ? Of the 12 face cards, 6 are red so $6/52 = 3/26$ and $3 + 26 = 29$
<b>2</b>	59	What is the largest prime factor of one thousand seven hundred and seventy? $1770 = 5 * 3 * 2 * 59$
<b>3</b>	42 [minutes]	Neepa takes thirty minutes to complete five-twelfths of an assignment. At this rate, how many more minutes will she need to complete the rest of the assignment? $5/12 = 30 \text{ min} \rightarrow 1/12 = 6 \text{ min} \rightarrow 7/12 = 42 \text{ min}$
<b>4</b>	10 [units]	An isosceles right triangle has the same area as a rectangle with side lengths 10 and 5 units. What is the length of one of the legs of the right triangle in units? Area of the rectangle = $10 \times 5 = 50$ . Triangle has area = $\frac{1}{2} (b)(h) = \frac{1}{2} \text{ leg}^2 = 50$ . $\text{Leg}^2 = 100$ , therefore leg = 10 units
<b>5</b>	105 [bowls]	A certain ice cream shop has fifteen flavors. How many different bowls containing two different flavors are possible? $15C_2 = 15 * 14 / 2 * 1 = 105$
<b>6</b>	6,000,000 [or 6 million]	As an integer, what is the product of one point five times ten to the negative third power and forty times ten to the eighth power? $1.5 \times 10^{-3} * 40 \times 10^8 = 60 * 10^5 = 6,000,000$
<b>7</b>	11 [widgets]	Three widgets cost the same as seven gizmos. Eleven gizmos cost the same as nine doodads. How many widgets cost the same as twenty-one doodads? $3w = 7g$ and $11g = 9d \rightarrow 33w = 77g$ and $77g = 63d$ , so $33w = 63d$ or $11w = 21d$ , so the answer is 11.
<b>8</b>	[ $n =$ ] 49	If $X$ equals two, $Y$ equals five, and $X$ times $Y$ times $N$ equals four hundred and ninety, what is the value of $N$ ? $2 * 5 * N = 490$ , $10N = 490$ , $N = 49$

<b>9</b>	21 [%]	In a survey of two hundred people about their favorite breakfast drink, eighty-six prefer plain water, twenty-two prefer juice, fifty prefer coffee, and the rest prefer tea. What percent of the people surveyed prefer tea? Water = 86, juice = 22, and coffee = 50, so $200 - 86 - 22 - 50 = 42$ , and $42/200 = 21/100 = 21\%$
<b>10</b>	1331 [ $\text{in}^3$ ]	In cubic inches, what is the volume of a cube with a side length of eleven inches? $11^3 = 1331$

# “Math is Cool” Masters -- 2022-23

## 8th grade

### College Bowl Round #6 Solutions

<b>8th</b>	<b>Answer</b>	<b>Solution</b>
<b>1</b>	15 [cents]	Baguettes cost two dollars and ninety-five cents each. Marina buys three baguettes with nine dollars. How many cents will she receive in change? $2.95 \times 3 = 8.85$ so there will be 15 cents left
<b>2</b>	24	Let A equal one, B equal two, C equal three, and so on, all the way up to Z equals twenty-six. What is the value of L plus E plus G? $A B C D E F G H I J K L, 5 + 7 + 12 = 24$
<b>3</b>	[x =] 22	What does X equal if two hundred and fifty X minus four thousand equals one thousand five hundred? $250x - 4000 = 1500 \rightarrow 250x = 5500 \rightarrow x = 22$
<b>4</b>	[A + B =] 7	A circular spinner with five congruent sections numbered one through five is spun twice. As a reduced common fraction, the probability that the sum of the two resulting numbers is greater than six is A over B. What is the value of A plus B? There are 25 possible results of which there are 11 that add to more than 6, (2, 5), (3, 4), (3, 5), (4, 3), (4, 4), (4, 5), (5, 2), (5, 3), (5, 4), (5, 5). So, the probability is $10/25 = 2/5$ , and $2 + 5 = 7$ .
<b>5</b>	6 [minutes]	Elias takes fifteen minutes to mow the lawn. It takes Martina ten minutes to mow the same lawn. In minutes, how long would it take Elias and Martina working together to mow the lawn? $1/15 + 1/10 = 1/x \rightarrow 2x + 3x = 30 \rightarrow 5x = 30 \rightarrow x = 6$
<b>6</b>	13 [inches]	The surface area of a rectangular prism whose base has dimensions four inches by seven inches is three hundred and forty-two square inches. In inches, what is the height of the prism? $4*h^2 + 7*h^2 + 4*7*2 = 342 \rightarrow 8h + 14h + 56 = 342 \rightarrow 22h = 286 \rightarrow h = 13$
<b>7</b>	48	What is the median of the positive two-digit multiples of twelve that are not also multiples of seven? The two-digit multiples of 12 that are not also multiples of 7 are 12, 24, 36, 48, 60, 72, 96, and the median is 48

<b>8</b>	3 [players]	A basketball team has fifteen players. If eighty percent of the players are at least six feet tall, how many of the players are less than six feet tall? $0.2 * 15 = 3$
<b>9</b>	153 [nickels]	How many nickels are needed to make seven dollars and sixty-five cents? $765/5 = 153$
<b>10</b>	3	There are four mugs on a shelf, mug one, mug two, mug three, and mug four. Four is shorter than both one and three. Two is shorter than four, and one is shorter than three. Which number mug is the tallest? Four < one and three, two < four, and one < three, so three is the tallest.

## 8th grade

### College Bowl Round EXTRA Solutions

<b>8th</b>	<b>Answer</b>	<b>Solution</b>
<b>1</b>	1400 [cat GIFs]	A two hundred and fifty-six gigabyte hard drive can hold twelve hundred cat videos or forty-two hundred cat GIFs. The hard drive has eight hundred cat videos. Assuming the remaining space is available, how many cat GIFs can be added to the hard drive? Eight hundred is $2/3$ of 1200, so there is $1/3$ of the space left, and $1/3$ of 4200 is 1400.
<b>2</b>	81 [integers]	How many two digit positive integers are there which consist of two distinct digits? $9*9 = 81$ Or, in total there are 90 2-digit integers. Subtract off 11, 22, ..., 99.
<b>3</b>	59 [minutes]	Eileen can make ten origami cranes every five minutes. Working at this rate, how many minutes would it take her to make one hundred and eighteen origami cranes? $10/5$ minutes = 2 per minute $118/2 = 59$ minutes
<b>4</b>	[A + B =] 17	As a reduced common fraction, the probability of rolling a prime number when rolling a twelve-sided die numbered one through twelve is A over B. What is the value of A plus B? 2, 3, 5, 7, 11 are five primes so the probability is $5/12$ and $5 + 12 = 17$
<b>5</b>	[A =] 320	The volume of a cone with a radius of eight centimeters and a height of fifteen centimeters is A times pi cubic centimeters. What is the value of A? $V = \pi r^2 h / 3 \rightarrow \pi * 64 * 15 / 3 = 320\pi$ , so the answer is 320
<b>6</b>	[x =] -24	What is the value of X if ninety X plus one hundred twenty equals eighty-five X? $90x + 120 = 85x \rightarrow 5x = -120 \rightarrow x = -24$
<b>7</b>	10 [units]	On the coordinate plane, find the distance in units between the points two comma negative one and eight comma seven. (2, -1) and (8, 7) are 6 units away horizontally and 8 units away vertically, forming a 6-8-10 right triangle.
